AI Tools Prompt Pack

Prompts that get real answers — not generic ones

By Elijah

How to use this pack

Pick a prompt. Replace everything in [brackets] with your own details. Add your context. Then read the answer and say what to fix — the second answer is usually the good one.

The formula behind every good prompt:

1. **Context** — what is this about, and who are you?
2. **Task** — exactly what do you want it to do?
3. **Format** — bullets, steps, under 100 words, a table — say how you want it back.

> **One rule for all of them:** the AI gives you a draft, not a decision. Check anything that matters — prices, addresses, code, facts — before you act on it.

1. Learn faster

1. Explain it simple

> Explain [topic] to me like I'm 15 years old. Use one everyday example. No big

> words unless you explain them first.

Use when: a topic sounds complicated and you want the plain version first.

2. Find my gaps

> Ask me 5 questions about [topic], one at a time. After each answer, tell me what I got right, what I missed, and what to study next.

Use when: you want to test yourself instead of just re-reading notes.

3. Check my explanation

> I will explain [topic] in my own words. Listen, then point out exactly where my explanation is wrong or incomplete.

Use when: you think you understand something and want proof.

4. Study plan

> Make me a 7-day study plan for [topic]. I have [X] minutes a day. Each day: one small lesson and one short exercise.

Use when: you want a plan you can actually follow, not a mountain of material.

5. Summarize it

> Summarize [text or topic] in 5 bullet points, then give me the one idea I must remember.

Use when: a long article, lesson, or video needs to become something you can keep.

2. Write clearly

6. Rewrite for clarity

> Rewrite this so a 15-year-old understands it. Keep all the facts. Cut every unnecessary word: [text]

Use when: your draft is correct but hard to read.

7. Opening lines

> Give me 5 opening lines for a post about [topic]. Each one must make the reader want the next sentence. No clickbait, no exaggeration.

Use when: you know what to say but not how to start.

8. Outline first

> Before you write anything, give me an outline for [piece] with 3 main points and one example under each.

Use when: you keep getting stuck halfway through writing.

9. Change the tone

> Rewrite this in a warm, direct tone, like a friend explaining it. No corporate language: [text]

Use when: your writing sounds stiff or robotic.

10. Cut the fluff

> Cut this to half its length. Keep every important point. Show me what you

> removed and why: [text]

Use when: your message is too long and people stop reading.

3. Build and code

11. Explain the error

> Explain this error message in plain words, then give me the most likely cause
> and the fix, step by step: [error]

Use when: an error message reads like a foreign language.

12. Plan before code

> Before writing code, break [project] into small steps I can build one at a time.
> List each step and what "done" looks like.

Use when: a project feels too big to start.

13. Review my code

> Review this code like a senior developer. List bugs first, then improvements,
> then what is already good: [code]

Use when: your code works but you want to know if it is good.

14. Debug with me

> Ask me one question at a time to find why [code] is not working. Do not give
> the answer until we find the cause together.

Use when: you want to understand the bug, not just copy a fix.

15. Learn a tool by building

> Teach me [tool] by building one small real thing with it. Explain each step as we go. No theory dump first.

Use when: tutorials bore you and you learn by doing.

4. Think and decide

16. Decide between two options

> Help me decide between [A] and [B]. List the real tradeoffs, what each choice costs, and what I should check before choosing. Then tell me which one you would pick and why.

Use when: you are stuck between two choices and going in circles.

17. Pros and cons that matter

> List the pros and cons of [decision]. Mark which three matter most and why.

Use when: a pros-and-cons list is too long to be useful.

18. Break the goal down

> Break [goal] into the smallest first step I can do today, then the next 3 steps. No vague advice — concrete actions only.

Use when: a goal feels big and you keep postponing it.

19. Argue against my plan

> Argue against my plan: [plan]. Find the weakest part and tell me what could

> go wrong.

Use when: you want the holes found before reality finds them.

20. Find the real cause

> Ask me "why" 5 times about [problem], one question at a time, until we reach the real cause.

Use when: you keep fixing symptoms and the problem keeps coming back.

5. Business and content

21. Real pain points

> List 10 pains people who [struggle with X] actually feel, in their own words. No generic problems — specific, real frustrations.

Use when: you want to sell something people actually need, not something you guess they need.

22. Product description

> Write a product description for [product] that says what it does, who it is for, and why it is worth the price — in under 80 words.

Use when: your product page says a lot and sells nothing.

23. Content ideas that teach

> Give me 10 post ideas about [topic] that teach something real. Each idea: one line on what the reader learns.

Use when: you want to post but have nothing worth saying.

24. Three angles for one offer

> Give me 3 different angles to present [offer]: one about the result, one about the pain it removes, one about the time it saves.

Use when: one offer, one post, and nobody is biting.

25. Respectful reply

> Draft a short, respectful reply to [comment or message] that answers the point and adds one useful idea. No begging, no pitch.

Use when: you want to be present in a conversation without selling in it.

6. Everyday AI use

26. Compare two things

> Compare [A] and [B] for [my use]. Tell me which fits better and what I give up with each.

Use when: two tools, two plans, two products — and reviews all say "it depends."

27. Plan the day

> Plan my [day or week] around [tasks]. Put the hardest task first, keep breaks, and leave room for things going wrong.

Use when: your plan falls apart by noon every day.

28. Explain a document

> Read this and tell me: what is it asking me to do, what is the deadline, and what happens if I ignore it: [document]

Use when: a long message, email, or form hides the one thing you must do.

29. Advice into a checklist

> Turn this advice into a checklist I can follow today: [advice]

Use when: good advice stays advice because nobody turned it into steps.

30. Questions to start with

> I want to ask an AI about [topic] but I don't know what to ask. Give me the 5 best questions to start with.

Use when: you are new to a topic and don't know where to begin.

> **The one rule, again:** Prompts do not make you smart. They make the tool useful. The thinking is still yours: check the answer, fix what is wrong, and keep the part that is right. That is how you learn — one piece at a time.
